

Cleaning Packaged Oil Before it Ships to Customers

This major commercial oil packager in the midwest area of the U.S. uses Donaldson HFK08 low-pressure/high-flow filters to remove contamination brought in by the additives, the inherent particulate in the tanks, and any other contaminants picked up during the mixing/packageing process. The result is oil that meets their customers' ISO cleanliness specifications.

Bulk Oil Tank

Donaldson
Filtration Solutions

Two HFK08 filters in parallel perform final filtration

before the bulk oil leaves the packaging plant and goes into tank trucks to be delivered to the customers. This final polishing ensures that the customer gets clean, safe-to-use oil.
